

QuaxBoard - Sprint 1

Features developed and tested

What we built (Sprint 1 roadmap)

- **SR1:** Launches Quax and shows an empty board window.
- **SR1.1:** Displays the correct game title based on the selected mode (Human vs Human / Human vs Bot).
- **SR1.2 & SR1.3:** Draws the Quax board in an 11x11 layout with octagonal and rhombic cells.
- **SR1.4 & SR1.5:** Labels the board correctly using A-K (columns) and 1-11 (rows).
- **SR2 / SR2.1 (partial):** Shows the text indicator “BLACK to play”. (Piece icons will be added in the next sprint.)

Testing we added (at least one test per feature)

We used JUnit 5 + TestFX UI tests. The tests start the app, query the UI using fx:id selectors, and check that the correct nodes are present. All tests pass when running **mvn test**.

Feature	Test case (what it checks)
SR1	The FXML loads and the boardPane exists (the app launches to a board window).
SR1.1	Changing the mode ComboBox updates the title label (and window title).
SR1.2 / SR1.3	After the first redraw, the board contains 121 octagons and 100 rhombi.
SR1.4 / SR1.5	There are A-K labels on top/bottom and 1-11 labels on left/right (counts match).
SR2 / SR2.1 (text)	The turnLabel starts as “BLACK to play”.

Deviations / notes

- No roadmap features were removed.
- SR2 piece icons (octagon + rhombus icons) are not included yet; only the text indicator is shown in Sprint 1.
- The UI was styled to look more like a game (dark background, centered board card). This is a visual improvement and does not change the required features.
