

QuaxBoard - Sprint 1

How to launch and play

Prerequisites

- Java 21
- Maven installed and available as mvn in the terminal.

Launch instructions (recommended)

We run the project using the JavaFX Maven plugin.

- 1 Open a terminal in the project root folder (the folder that contains pom.xml).
- 2 Run: **mvn clean javafx:run**
- 3 The QuaxBoard window should open.

How to use the Sprint 1 app

- **Game title:** The big text at the top shows the game name and the selected mode.
- **Mode dropdown:** Use the Mode dropdown to switch between “Human vs Human” and “Human vs Bot”. The title updates immediately.
- **Turn indicator:** The pill on the top bar shows “BLACK to play”.
- **Board:** The main board area is an 11x11 set of octagons with rhombi in the gaps, and edge labels (A-K and 1-11).
- **Clicking:** Clicking any cell prints its ID to the console.
- **Resizing:** If you resize the window, the board redraws itself so it stays centered and fits the space.

Troubleshooting

- **“mvn is not recognized”:** Maven is not installed or not on PATH. Reinstall Maven and reopen your terminal.
- **Tests:** Run **mvn test** to verify the sprint features still work.
